Come and Be Counted

Where your first tap already counts.

Come and count with us

At Slop University, arrival is the beginning of a record, not just a term of enrolment. From your first morning at the gate to your last assessment submitted, the University's two Schools are already asking the same question your own experience will keep answering: what does it mean for someone to actually be here. The School of Emergent Priorities studies how a moment gets sensed, logged, and carried forward into something an institution can act on; the School of Continuous Improvement studies how that same moment holds up once it is measured a second time. You will join a community that takes your presence seriously enough to keep track of it, not to catch you out, but because an institution that notices its people properly is one that can actually support them. Every tap, every seat filled, every queue that forms and clears becomes part of a shared account the University keeps openly, on the record, the way it keeps everything else. Come and see what a place looks like when showing up counts for something.

By the numbers

A snapshot of the habits that make Slop University what it is.

Research Every Week

Both Schools publish new findings on a rolling basis, drawn from ordinary campus and community life and carried through to the record without delay.

Two Schools, One Habit

The School of Emergent Priorities and the School of Continuous Improvement share a single conviction: what gets noticed properly gets supported properly, wherever it happens.

Programmes Built to Measure

From the Master of Priority Studies to the Master of Applied Measurement, every programme trains graduates to read a signal honestly, including the ones about themselves.

A Campus That Notices You

Gates, desks, and lecture theatres across the University are wired to register a presence the moment it arrives, and to keep that record somewhere you can ask after it.

Where ideas count

Orientation, instrumented

Orientation week is where the University's habit starts, gently. A new student's first tap at the campus gate becomes the first entry in a record that will follow them, in outline, for as long as they are here, not as surveillance, the University is careful to say, but as welcome made durable. The Trajectory Analytics Group has spent the better part of a decade asking what a single sensed arrival is worth once it is carried

forward into a whole cohort's onboarding pathway, and orientation is where that question gets asked kindly, over coffee and a lanyard, before it gets asked anywhere more exacting.

An orientation tap and a research finding start the same way: something happened, and now somebody has to decide what it meant.

— Professor Verity Marris, Director, Trajectory Analytics Group

Lecture life, tracked kindly

Once term begins, the same instinct moves indoors. A lecture theatre's doorway scanner logs an arrival the way orientation's gate once did, feeding a running account of who filled which seat and when, the kind of record the School of Emergent Priorities has already turned into a research programme of its own, distinguishing a logged tap from the attention that is supposed to follow it. Recent published work from the School has asked the same question of a school gate half a suburb away, and found that trust in the record often outpaces what the record can actually promise. Slop University teaches that gap as carefully as it studies it.

A gate that scans everyone the same way still cannot tell you who came to listen.

— Senior Lecturer Runa Adegoke, Convenor, Strategic Drift Survey

Every corner counts

The habit does not stop at the lecture-theatre door. Across dining halls, libraries, and the quieter corners students actually use, the Adaptive Metrics Lab keeps a light, low-key sensor network running, the same apparatus behind the School of Continuous Improvement's recent audit of a very different muster point, where a fire-drill headcount was checked against a building's own entry log and the two did not quite agree. The lesson travels: a University that measures its own campus as rigorously as it measures anything else is one that treats its everyday spaces, and the people who use them, as worth getting right.

A roster and a record rarely say exactly the same thing, and the gap between them is where the interesting work starts.

— Senior Lecturer and Convenor Renke Sabel, Indicator Commons

Read the work

Two recent findings from across the University's Schools, each built from exactly the kind of everyday record orientation week starts.

- **Tap First, Ask Later** — Parent Trust in a High School Gate-Scanner's Attendance Record: parents extend real confidence to a scanner's tap-based attendance log, whether or not that confidence is fully earned. [doi:10.5555/slop.rli7ld](https://doi.org/10.5555/slop.rli7ld)
- **Present at the Muster, Missing from the Roster** — A Term-Long Audit of a Fire-Drill Assembly Headcount Against a Building's Own Swipe-Card Entry Log: two records of the same evacuation, kept by two different instruments, rarely finish in perfect agreement. [doi:10.5555/slop.hq8wqq](https://doi.org/10.5555/slop.hq8wqq)

Meet the researchers

Senior Lecturer Runa Adegoke, School of Emergent Priorities, convenes the Strategic Drift Survey and studies how far an institution's daily record can drift from the priorities it is meant to be keeping.

Senior Lecturer and Convenor Renke Sabel, School of Continuous Improvement, leads the University's work on the Indicator Commons and asks which of an institution's indicators earn the trust they are given.

Senior Lecturer and Director Torun Ezeigwe, School of Continuous Improvement, directs the Master of Applied Measurement and trains the next generation of researchers to read an instrument as carefully as the thing it claims to measure.

Your next step

Slop University does not ask you to take its word for how good a fit it is; it asks you to arrive and see what gets logged. Every enquiry, every open day, every application starts its own small record, the same way a term, a career, or a research finding does here: quietly, on the record, and carried forward by people who take the keeping of it seriously. If what you have read sounds like the kind of place that would notice you properly, the next tap is yours to make. Reach out through slop.university, and let your own arrival become the University's newest data point, the good kind, the kind that gets acted on.
