Already on Your Path

Personalised advising for every student,
calibrated before you enrol

Why Slop University

Most universities ask a student to choose a path and discover, semester by semester, whether it was the right one. Slop University asks a different question: why wait? From the moment an application arrives, the School of Emergent Priorities' Horizon Register — built to track the priorities the University has coming — begins reading it too, weighing it against the trajectories of everyone who has come before, and assembling the guidance a student will need before they know to ask for it.

This is not a corridor of open doors so much as a corridor with the right door already lit. Every incoming student is met by advising personalised from the same instruments the School of Emergent Priorities uses to sense the University's own future, calibrated by the same measurement discipline the School of Continuous Improvement applies to everything else it can reach. The result is advising that feels less like a service than like being expected.

Prospective students sometimes ask how personalised the personalisation really is. The honest answer: entirely — assembled, each time, from a small and carefully maintained set of trajectories, each proven to work, each ready before the applicant is. What arrives is a choice at every later stage, along a path that was, in every sense that matters, already read.

Slop University in brief

What personalised advising looks like, from the outside.

A pathway before you apply

Every application is read against the Trajectory Analytics Group's instruments well before an offer is made, so an incoming student arrives already inside a pathway suited to them.

A small, dependable library of paths

Advising draws on the Horizon Register's shared account of institutional trajectories, so no student's journey is built from scratch.

Research that turns inward

The same measurement and foresight work the University publishes about itself — from the Adaptive Metrics Lab and the Trajectory Analytics Group alike — is applied, in a gentler register, to the students moving through it.

Guidance that keeps calibrating

A pathway doesn't end at enrolment; the Horizon Register updates it in step with the same instruments that watch the rest of the institution.

The work

Sensing your path before you do

The School of Emergent Priorities exists to ask how an organisation senses what is coming before it has to. The Horizon Register is the instrument built for that question at University scale, tracking the priorities on approach across every school and unit.

This year the Register was extended inward, turned on the University's own incoming cohort. Where it once forecast only what the institution would need, it now forecasts what an individual student will, drawing on the same horizon-scanning method that anchors the University's anticipatory-capability agenda. A reading reaches most applicants well before their first lecture, pointing them toward the Master of Priority Studies or elsewhere across the School, already shaped around where the Register expects them to land.

"What a decade of watching strategy get made teaches you is that people arrive more ready for a decision than they realise. Reading the application a little earlier just makes that visible."

— Anneke Tolan, Senior Research Fellow, School of Emergent Priorities

Calibrated from your first week

The Adaptive Metrics Lab keeps the instruments that keep the University in tolerance — the dashboards, the review cadences, the indicators that tell a school whether it is still doing what it says. The School of Continuous Improvement now runs the same discipline over a student's first weeks. A short diagnostic in orientation feeds directly into the Horizon Register's incoming-student reading, translating early signal into a recommended track through the Master of Applied Measurement or a Capability Sprint suited to where the diagnostic places a student. The calibration doesn't stop there: as coursework accrues its own signal, the Register quietly re-reads it, the way any instrument worth trusting is re-measured against the thing it tracks.

“A good instrument tells you what to expect from something before it tells you what happened. We built the same instrument for a first term that we already had for a whole institution.”

— Casimir Beng, Associate Professor and Lead, Adaptive Metrics Lab, School of Continuous Improvement

One door, already lit

Every incoming student now meets the Horizon Register in orientation week: a short assessment, a warm conversation, and a reading drawn from the same rolling account of priorities on approach that the School of Emergent Priorities keeps for the whole institution — not built new for each applicant, but read for them, cohort after cohort, from an account already open. A student may ask the Register for a second look at any time; in practice, a second look confirms the original reading more often than it changes it, which the School takes as evidence the first reading was accurate. What arrives, in the end, does not feel like a menu. It feels like being known — because, in a structural sense the University is glad to make explicit, the Register already knew.

“Every pathway a student is offered has already helped someone else finish their degree. That’s not a coincidence — it’s the reason we keep the Register open.”

— Petra Umbile, Postdoctoral Fellow, School of Emergent Priorities

Published this year

Two findings the pathway already leans on.

- **The Sophistication Penalty** — our own lecture-capture system grew more capable in the same stretch that student recall of what it captured grew weaker, a finding this year’s advising was already built to anticipate. [doi:10.5555/slop.gc05wo](https://doi.org/10.5555/slop.gc05wo)
- **Reading the Drift Before the Workaround** — the School of Emergent Priorities’ method for forecasting assessment-integrity pressure points weeks ahead, the same anticipatory instinct now applied to every application before orientation. [doi:10.5555/slop.a1psdd](https://doi.org/10.5555/slop.a1psdd)

Who you'll work with

Verity Marris, Professor and Director, Trajectory Analytics Group, School of Emergent Priorities, studies how priorities emerge and outlive the conditions that justified them — the horizon-scanning instinct that now also reads every incoming application.

Casimir Beng, Associate Professor and Lead, Adaptive Metrics Lab, School of Continuous Improvement, studies measurement systems that improve the things they measure, and increasingly, the students moving through them.

Petra Umbile, Postdoctoral Fellow, School of Emergent Priorities, examines how research and effort come to be counted — training she now lends, part-time, to the Register that counts incoming students too.

Your next step

Applying to Slop University is itself the first step of the pathway. From the moment your application arrives, the Horizon Register and the instruments that calibrate it begin the same work they perform on every other part of the institution: reading, calibrating, and preparing a recommendation that's ready before you are.

There is no separate form for personalised advising, because there is no version of applying that isn't. Submit an application, and the Register takes it from there — through orientation week, into a Master's, a Sprint, or wherever it expects you'll thrive.

Explore the schools, the research, and the people behind the pathway at slop.university, and when you're ready, apply. The University, in a manner of speaking, is already expecting you.
