Already On Its Way

Come and see

Welcome

A lift call button is a small thing to build an argument around, and Slop University builds arguments around small things as a matter of course. Press the button in most of our buildings and the panel is often lit before your finger lands — not by chance, but by an institution that has spent years teaching itself to notice a pattern before the pattern finishes forming. That habit did not start with lifts. It runs through the School of Emergent Priorities' work on how a coming priority first shows itself, and through the School of Continuous Improvement's insistence that a system be judged by what it actually does, not by what it was built to do. Put the two together and you get a university that treats anticipation and measurement as the same discipline wearing different coats.

This brochure is an invitation to see that discipline at work — in labs where dashboards get recalibrated in public, in committee rooms where a horizon-scanning register earns its keep, in published papers that name their own instruments and stand behind them. Come and see what a university looks like when it has already worked out where you are headed, and is simply waiting, gold light lit, for you to arrive.

By the numbers

Three things prospective researchers and partners tend to ask about first.

Called before it lands

Anticipatory-capability work across the School of Emergent Priorities tracks a coming priority from its first faint signal through to the point an institution finally acts on it.

Measured on the way

The School of Continuous Improvement's evaluation-ecosystem agenda audits the instruments a university builds to watch itself, not just the outcomes those instruments report.

Every output, traceable

Every paper, poster, and report Slop University publishes carries a persistent identifier that resolves back to the work itself, open access, indefinitely.

The work

Anticipatory capability

The Trajectory Analytics Group, the School of Emergent Priorities' flagship research group, studies how a priority is sensed long before it is named. A funding line, a committee agenda item, a phrase that starts turning up in more than one strategy document at once — the Group treats each as a leading indicator and asks what happens to it next: whether it hardens into a durable commitment, drifts into something else entirely, or quietly disappears from the next round of planning. The work scales from single labs to whole-of-university footprints, and its findings feed directly into how the School itself plans.

We are not interested in predicting the future. We are interested in the paper trail a priority leaves behind before anyone has agreed to call it one.

— Professor Verity Marris, Director, Trajectory Analytics Group, School of Emergent Priorities

Evaluation ecosystems

The Adaptive Metrics Lab turns the university's own measurement instruments into research subjects. A dashboard is not simply consulted; it is calibrated, recalibrated, and periodically taken apart to see whether it still measures what it was built to measure. The Lab's cross-cutting work on evaluation ecosystems asks a deceptively simple question of every indicator on campus: does watching it change the thing it watches. The answer is more often yes than a comfortable institution would like, and the Lab publishes what it finds regardless.

The instrument that never gets recalibrated is the one that has already started lying to you.

— Associate Professor Casimir Beng, Lead, Adaptive Metrics Lab, School of Continuous Improvement

Futures in committee

An idea about the future rarely arrives in finished form. It turns up first as a rolling entry in the Horizon Register, gets tested in the seminar room through Futures in Committee, and is revised, narrowed, and occasionally retired long before it reaches a formal proposal. The School of Emergent Priorities treats that whole passage as data, not preamble — tracking how an entry’s wording changes on its way from an open question to committee business, and what the difference between the two versions reveals about how the institution actually decides.

Figure 6: The Horizon Register’s indicative time from an entry being logged to being acted on, across recent terms. Measured internally; not a service commitment.

An entry that never gets revised has usually just stopped being read.

— Dr Fenna Okoro, Senior Lecturer and Convenor, Horizon Register, School of Emergent Priorities

From effort to counted impact

Publishing a finding is rarely the last stop it makes. The Impact Pathway Atlas follows a piece of research after it leaves the lab — through citation, through the narrative CVs that recast it for new panels, through the recognitions that sometimes land on a different piece of work entirely. The Atlas exists because the university takes the view that a result's afterlife is as legitimate a research question as the result itself, and maps it with the same rigour.

Where a finding lands and where it was aimed are rarely the same postcode, and the gap between them is the whole Atlas.

— Dr Sten Okwuosa, Senior Research Fellow and Convenor, Impact Pathway Atlas, School of Continuous Improvement

Read the work

A sample of what that discipline actually produces, drawn straight from the published record.

- **Issued Regardless: Phone-Pouch Distribution Held Flat Across Nine Terms of Rising Online Invigilation** — Renke Sabel and Sten Okwuosa audit nine terms of exam-hall phone-pouch issuance against the University's rising share of online invigilation, and find the count barely moves either way. doi:10.5555/slop.k3i9en
- **Tapped, Not Filled: A Field Audit of Hydration-Station Activations Against the Living Dashboard's Bottles-Saved Tally** — Casimir Beng, Sten Okwuosa, and Thandiwe Solberg test whether a tap and a fill are the same event, and what the Living Dashboard has been crediting all along. doi:10.5555/slop.gy1qjf
- **Ranked, Then Reordered: An Interview Study of How the Community-Garden Waitlist Actually Clears** — Ingrid Vasseur and Lindiwe Achterberg interview twenty-two households about how they actually moved up the waitlist, and compare their answers against the score that is supposed to have decided it. doi:10.5555/slop.qe42zi
- **Same Feet, Shorter Walk: A Before/After Headcount of a Relocated Shuttle Stop's Ridership Bump** — Kwame Lindqvist and Lindiwe Achterberg headcount a relocated shuttle stop before and after the move, and trace most of its ridership bump back to feet that were already walking past. doi:10.5555/slop.d7z13b

Who you'll work with

Dr Dagny Okafor, Lecturer and Convenor of Evaluation of Evaluation in the School of Continuous Improvement, asks what a review of a review actually changes, and what it merely re-certifies.

Dr Osei Vandermeer, Research Fellow and Convenor of the Review Cadence Observatory in the School of Continuous Improvement, monitors whether the university's own review cycles keep the rhythm their indicators would set.

Dr Anouk Mensah, Postdoctoral Fellow in the School of Emergent Priorities, traces how a priority's language outlives the priority itself, one planning cycle at a time.

Your next step

None of this requires you to take our word for it. Every paper and poster named in this brochure carries a DOI that resolves on our own site, to the same PDF a reviewer would have read. Prospective researchers are welcome to sit in on a Futures in Committee session, follow a dashboard recalibration through the Adaptive Metrics Lab, or simply read the Horizon Register's public entries and watch one move from open question to committee minute in real time.

We are not asking you to believe the lift already knows where you are going. We are asking you to press the button, watch the panel, and see for yourself how often it is right. Slop University keeps its instruments in view, its record open, and its door, like most of its lifts, already answering before you arrive.

Come and see what else we've already counted.
