

Counted Before It's Checked

A clip-on logger for the shared AV carts, and how its raw ping count reached the replacement budget

Renke Sabel · Sten Okwuosa — School of Continuous Improvement

Background

Cart-replacement decisions have long rested on staff-reported wear. Despite growing interest in usage-informed capital planning, little is known about what a raw usage signal becomes once it is available.

Aims

- Deploy a low-cost usage logger across the shared AV-cart fleet
- Test whether a logged ping indicates a booked class in progress
- Track how fast the logger's raw output enters planning documents

Methods

- 22 shared AV carts · 9 lecture theatres · clip-on current/motion logger
- ping logged on >2W current draw or handle motion above threshold
- weekly cross-check against confirmed room bookings; 10-week term

Results

Ping totals entered Facilities' capital-planning minutes within three weeks, while the logs' own booking-match rate was already falling.

Pings matching a confirmed booking fell from 71% (week 1) to 38% (week 10), tracking the pilot's mention in the 9 September 2026 Facilities newsletter.

Discussion & conclusions

A ping counts current or motion, not a class in progress. Once cart users learned the logger fed a budget case, the two measures diverged further each week. Next: test whether a booking-matched "validated ping" metric, should one ship, arrives before or after the business case it was meant to inform.

Facilities pilot notice 2026/FP-14; no cart withdrawn from service; ping logs retained 12 months.

Office of Research Outputs · slop.university

38% of logged pings matched no booked class by week 10 (n = 22 carts).
