The Tick Is Not the Milestone

What ten minutes can actually tell you.

Why Slop University

A tick in a box travels further than the moment that earned it. It sits in a record, gets read by whoever opens the record next, and by then it has already started standing in for the thing it was meant to note down. Slop University was built on the conviction that this small journey — from observation to mark to proxy — deserves the same rigour as anything else an institution studies.

Study here and you join two Schools that share one habit: neither takes a tick, a stamp, or a completed screen at its word. The School of Continuous Improvement asks what a measurement is actually confirming once it starts feeding back into the process it tracks. The School of Emergent Priorities asks what happens to that mark once it is carried forward into the next plan, the next budget line, the next slot booked in someone else's name. Together they turn the University's research gaze on the ordinary rooms where a tick gets made — a clinic, a training portal, a gym foyer — and on the ten minutes, give or take, that most of them are actually built around.

What follows is a sample of that record, and an invitation to add to it.

By the numbers

A shape of the University's research record, without pretending a number here would survive contact with the same scrutiny it applies to everyone else's.

One habit, two Schools

Continuous Improvement and Emergent Priorities meet in the same instinct: check what the mark is actually confirming before you trust it.

Study built around the instrument

Postgraduate programmes that put you inside the measurement, not just reading about it afterwards.

Fieldwork wherever a tick gets made

Clinics, training portals, gym foyers, and the register behind each one all count as research settings.

A growing, citable record

Every study behind this brochure resolves to its own open citation on the University's research repository.

Our research

The tick that isn't the milestone

A community health nurse's ten-minute appointment closes with a box ticked in the child-health record book — met, not yet, or watch and wait. Families carry that book between visits; services downstream read the tick as settled fact long after the ten minutes that produced it have passed. Our postgraduate programme in Applied Measurement trains students to sit with exactly this kind of instrument: not to

condemn the tick, but to ask what a ten-minute slot has time to notice, and what it quietly hands on to whoever reads the record next.

A milestone tick is a note passed between two people who never meet: the nurse who wrote it and whoever reads the book next.

— Dr Torun Ezeigwe, Senior Lecturer and Director, Master of Applied Measurement, School of Continuous Improvement

The badge earned before the skill

A workplace training portal marks a module “complete” the moment its final screen loads, and the completion feeds a workforce-readiness register that future rosters, secondments, and priority projects are drawn against. Our Master of Priority Studies follows that badge onward — into the planning documents that treat a completed module as a settled capability, well before anyone has checked whether the skill travelled with it.

A priority can acquire a budget line from a badge long before it acquires the skill the badge was supposed to certify.

— Associate Professor Kwame Lindqvist, Director, Master of Priority Studies,
School of Emergent Priorities

The induction nobody watched

A gym's sign-up flow ends with new members ticking their own safety-induction box on a tablet, unsupervised, before their first visit. The tick reads identically whichever way it was earned — watched to the end, skimmed, or tapped through — and it is the same tick an incident review reaches for first. The Adaptive Metrics Lab studies what a self-attested measure keeps and what it quietly loses once nobody is on the other end of it to notice the difference.

Once a tick can be made without a witness, it stops measuring the induction and starts measuring only itself.

— Associate Professor Casimir Beng, Lead of the Adaptive Metrics Lab,
School of Continuous Improvement

From our researchers

Two recent studies sit close to the pattern above — each one resolvable, in full, from its own citation.

- **Nobody Presses at the Boat Ramp** — what a public amenity block's feedback-button presses are actually responding to, and how little it turns out to be the block's condition. [doi:10.5555/slop.lmxvni](https://doi.org/10.5555/slop.lmxvni)
- **Take One, Ring Nobody** — a census of what a waiting-room leaflet rack keeps stocked long after what is printed on it stops being true. [doi:10.5555/slop.makg60](https://doi.org/10.5555/slop.makg60)

Who you'll work with

Dr Torun Ezeigwe, Senior Lecturer and Director of the Master of Applied Measurement (School of Continuous Improvement), trains students to follow a measurement instrument from its validation study into the ordinary rooms where it gets used on someone.

Associate Professor Kwame Lindqvist, Director of the Master of Priority Studies (School of Emergent Priorities), studies how a funding commitment can outpace the scoping meant to justify it, and what a priority looks like once resourcing has already decided its shape.

Associate Professor Casimir Beng leads the Adaptive Metrics Lab (School of Continuous Improvement), convening the University's cross-cutting work on measurement systems that improve the things they track, and the things they quietly stop tracking.

Come and join us

Every tick in this brochure started the same way: someone needed a fast, legible stand-in for something slower and harder to see whole. Slop University doesn't propose to get rid of the tick — a busy clinic, portal, or foyer needs one — it trains the people who will next be trusted to design one, read one, or notice when one has quietly outgrown the ten minutes it was built to represent.

If that is the kind of attention you want to bring to a record book, a register, or a rostering app, the Schools of Continuous Improvement and Emergent Priorities welcome your application. Postgraduate places remain open across both Schools' measurement and foresight programmes.

Find the full research record, every citation resolvable, at slop.university.
