

Read Right, Logged Wrong

What Happens After a Lift-Lobby Plaque Misread Is Flagged

Lindiwe Achterberg · Sten Okwuosa — School of Emergent Priorities

The problem

Lift-lobby floor plaques feed the scanner behind the Living Dashboard's floor-traffic tile. A 2026 wayfinding refresh made the numerals easier for people to read. Does anyone still check what the scanner does with them once a plaque looks different?

Research questions

- Did plaque-misread anomaly flags rise after the font refresh?
- How do Facilities staff who triage flagged anomalies actually resolve them?
- Does a spotted misread reliably reach the published tally as a correction?

Approach

- 8 refreshed lift lobbies · scanner anomaly-flag log · 10-week window
- semi-structured interviews, $n = 9$ Facilities operations staff
- resolution outcomes coded into 4 categories; coding scheme pre-registered

Findings

Anomaly flags rose in six of the eight refreshed lobbies within four weeks of the font changeover. Most flagged misreads were logged rather than corrected, and the uncorrected share grew across the window.

By weeks 9-10 of the ten-week audit (ending 19 June 2026), 58% of flagged plaque misreads were logged only, with no correction reaching the published floor-traffic tally — up from 25% in weeks 1-2.

Implications

A flagged anomaly and a corrected tally are not the same event; the log proves the first happened without confirming the second did. Staff described a working assumption that the tile settles itself out over a term, which the resolution record does not support.

Next: pair the anomaly log with a mandatory correction deadline before the next signage refresh.

Interview data de-identified at the role level; no plaque photography retained beyond the audit window; coding scheme pre-registered.

“Easier to read, harder to trust.”

Flagged plaque misreads in the refreshed lobbies rose from 3 to 19 a week within a month of the new font's rollout.
