

Booked Full, Sat Empty

Validating the Timetabling Office’s Occupancy Forecast Against a Term of Clicker-Recorded Attendance

Fenna Okoro · Ingrid Vasseur — School of Emergent Priorities

The problem

Timetabling caps or grows a subject’s enrolment against a pre-term occupancy forecast. Whether that forecast still describes the room once the term is under way is rarely checked against what the room actually does.

Research questions

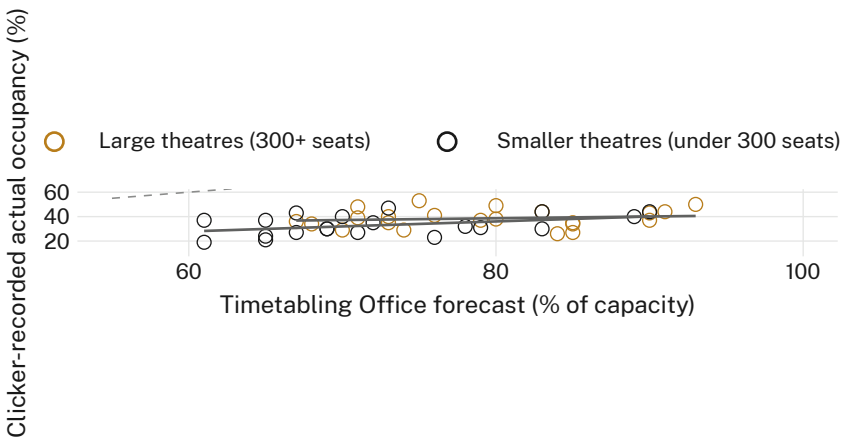

- Does the forecast track clicker-recorded attendance across a term?
- Does the forecast-to-actual gap narrow as the term progresses?
- Does the gap differ between large and small lecture theatres?

Study design

- n = 214 timetabled sessions · 9 lecture theatres · ceiling-mounted infrared clickers, 5-min sampling · 13-week term, Semester 1 2026
- session forecasts drawn from the Timetabling Office’s own pre-term capacity model, held fixed throughout (no mid-term recalibration)
- theatres classified 300+ / under-300 seats before data collection

Findings

Forecast occupancy correlates weakly with clicker-recorded attendance ($r = 0.38$, $n = 214$). The forecast exceeds recorded attendance in 189 of 214 sessions (88%), a margin that does not narrow between week 1 and week 13.

Forecast occupancy exceeded clicker-recorded attendance in 88% of the term’s 214 sessions; the median overshoot widened from 21 points in week 1 to 26 points in week 13, Semester 1 2026.

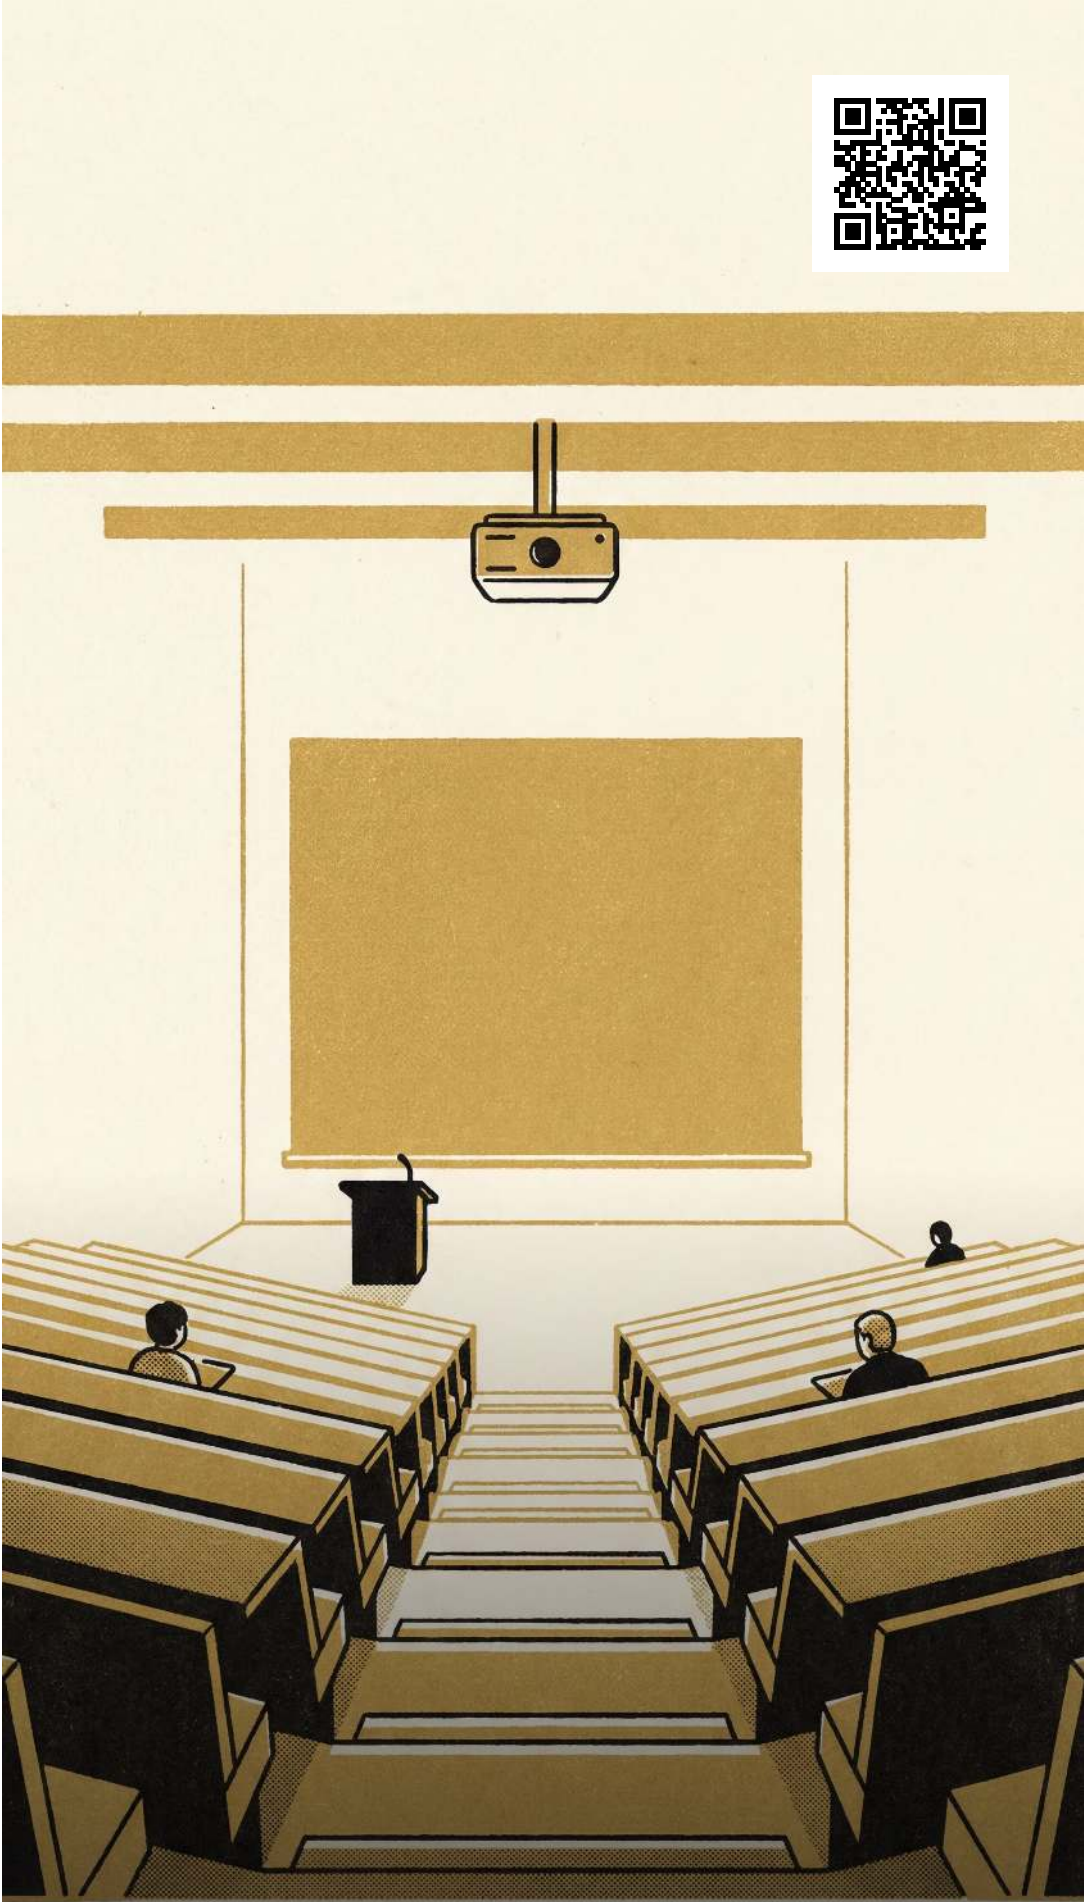

Implications & next steps

The forecast tracks the timetable, not the room — a model built on historical enrolment outlives the cap it once justified. Next: recalibrate mid-term against the clicker feed.
