

Flagged, Then Funded

Validating the Horizon Register's Early-Warning Alerts Against What a Priority Actually Receives

Verity Marris · Petra Umbile — School of Emergent Priorities

Background

The Horizon Register flags priorities before they harden into commitments, so units can plan around what is coming. Little is known about what actually clears the threshold: the priority's novelty, or the unit's diligence in feeding the Register.

Aims

- Test whether Register alert scores predict which flagged priorities are resourced
- Compare status-update volume against novelty score as competing predictors
- Establish whether the threshold tracks the priority, or the unit's reporting habit

Methods

- 84 priorities flagged Jan 2025–Jun 2026, both Schools, drawn from the Register audit log
- Logistic regression: resourcing outcome update-volume percentile + novelty percentile
- Novelty blind-coded by an independent three-reviewer panel; thresholds held fixed throughout

Results

Update-volume percentile predicts resourcing with moderate-to-strong reliability (AUC = 0.81); novelty percentile performs little above chance (AUC = 0.58). The two measures correlate weakly ($r = 0.21$).

Across 84 priorities flagged between January 2025 and June 2026, update-volume percentile tracks resourcing outcome ($r = 0.72$); novelty percentile does not ($r = 0.19$).

Discussion & conclusions

The Register's alert threshold rewards documentation more reliably than it detects emergence. A priority that is merely well-reported clears the line as readily as one that is genuinely arriving. Next: recalibrate the threshold against a novelty-only baseline ahead of the Register's next scheduled refresh.

“The best predictor of resourcing wasn't the priority. It was the paperwork.”

Update-volume percentile out-predicts novelty percentile more than three to one across 84 flagged priorities, Jan 2025–Jun 2026.
