Auditing the Horizon Register's Mandatory Induction Module Against an Unannounced Comprehension Check

Verity Marris · Anneke Tolan · Petra Umbile — School of Emergent Priorities

Background

New starters complete a mandatory Horizon Register induction module before being logged as priority-aligned. Whether it changes what they can name has gone unchecked.

Aims

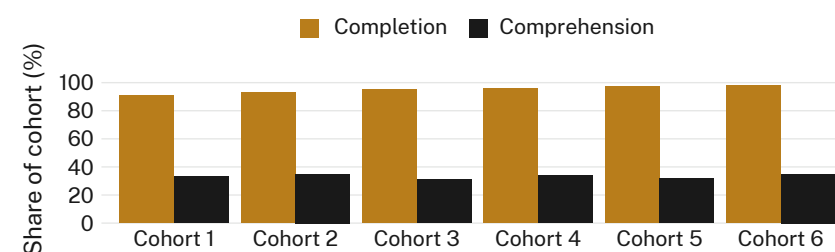

- Certificate issuance vs. an unannounced comprehension check
- Whether completion time tracks anything new starters recall
- Whether the reported completion rate moves with actual recall

Methods

- $n = 238$ · 6 quarterly cohorts · self-paced module, graded exit quiz gating the certificate
- Unannounced two-item comprehension check, 2 weeks post-completion
- Content and quiz gate held constant; completion time a covariate

Results

Completion rose from 91% to 98% as median time fell from 34 to 9 minutes; comprehension held at 31-35% throughout ($r = 0.06$, $n = 238$).

Completion rose from 91% to 98% of new starters across six quarterly cohorts ($n = 238$); the comprehension check two weeks later held at 31-35% throughout, unmoved by falling completion time ($r = 0.06$).

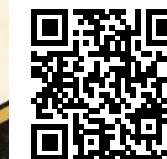

Discussion & conclusions

The certificate rate reported to leadership moved every quarter; recall did not. Falling completion time tracked growing familiarity with the quiz gate, not the register's content. Next: piloting a comprehension-weighted completion metric alongside the certificate count.

- Comprehension responses de-identified before scoring; completion-time data held separately from performance review.

Office of Research Outputs · slop.university

“98% finished the module. About a third could say what it covered.”

Comprehension pass rate held at 31-35% across six quarterly cohorts ($n = 238$).
