The Tour That Shows Its Workings

See Every Instrument the University
Actually Trusts

Why Slop University

Most campus tours show you buildings. Ours shows you what runs inside them.

Every visit to Slop University follows the same route a working day takes: past the quad, into a lab mid-reading, through a seminar in progress, onto a stage where a term's work gets demonstrated live. Nothing is staged for the visit — you see the instrument doing what it does on any other Tuesday, dial, chart, and all.

The two Schools that make up the University — the School of Emergent Priorities and the School of Continuous Improvement — share one working assumption: that an institution understands itself only as well as it can measure itself. A tour that skipped the measuring would be a tour of the wrong thing, so ours doesn't.

Come and see what the University actually watches, not just what it says. Bring a question; the guide has read the same dashboard you're about to.

At a glance

A short account of what a visit to Slop University actually covers.

One route, two Schools

The tour crosses both the School of Emergent Priorities and the School of Continuous Improvement in a single afternoon, on foot.

Labs, mid-reading

Visitors see instruments running live, not switched on for the occasion — the Adaptive Metrics Lab included.

A shared habit of counting

Every stop on the route belongs to an institution that treats measuring itself as part of the work, not an afterthought.

A tour that ends in the record

The route finishes where the University's published research begins, DOI and all.

What we do

Where Priorities Get Traced

The tour's first stop is the Trajectory Analytics Group's briefing room, where the School of Emergent Priorities' Horizon Register scrolls in real time along one wall — a rolling account of the priorities the University expects to face before they arrive. Visitors don't get a summary slide; they get the actual register, the same one a unit consults before a funding round or a five-year plan. A researcher walks the group through how an item is logged, revised, and, eventually, retired, and answers whatever the room asks, including the questions the guide didn't expect.

Students who go on to study in the Master of Priority Studies spend their first term learning to read exactly this kind of instrument. The tour just gets there first.

We show visitors the Register itself, not a tidied-up version of it. An instrument only means something if you're willing to let people see it mid-use.

— Verity Marris, Professor and Director, Trajectory Analytics Group

Where the Dashboard Lives

From there the route crosses to the School of Continuous Improvement and the Adaptive Metrics Lab, where the Living Dashboard occupies most of one wall. The Lab studies measurement systems that improve the things they measure, and its own dashboard is the first exhibit: dials, sparklines, and a standing invitation to ask what any of them is actually tracking.

Visitors are welcome to press a button, if a researcher is nearby to explain what happens next. Most tours don't get that close to the instruments.

An institution that studies measurement owes its visitors an honest look at its own. We'd rather show you the dashboard than describe it.

— Casimir Beng, Associate Professor and Lead, Adaptive Metrics Lab

Where the Work Gets Demonstrated

The route closes at Demo Quarter, the School of Continuous Improvement's quarterly showcase, where a Capability Sprints cohort presents a term's work to whoever turns up, visitors included — the version judged fit to demonstrate, not a rehearsal cut built for the tour. For a prospective student, watching someone two years ahead of them defend that work live tends to do more than any brochure page can.

A showcase is only useful if the audience can ask the awkward question. We keep the floor open for visitors, same as we do for everyone else.

— Thandiwe Solberg, Senior Lecturer and Convenor, Demo Quarter

Read the work

The route ends at the record. Two pieces published this year sit close to what the tour just walked past.

- **Flagged, Then Funded — Validating the Horizon Register’s Early-Warning Alerts Against What a Priority Actually Receives** — a look inside the very Register the tour’s first stop scrolls through, and what its alerts actually predict. [doi:10.5555/slop.4wzjf0](https://doi.org/10.5555/slop.4wzjf0)
- **Built Not to Watch — How CheckPoint’s Participation Logs Reached the Living Dashboard Anyway** — a look at whether the Dashboard visitors are invited to press keeps the boundaries the School promised to keep. [doi:10.5555/slop.hxwf45](https://doi.org/10.5555/slop.hxwf45)

Our people

Marek Solheim, Lecturer, School of Emergent Priorities, studies what becomes of the priorities an institution has stopped pursuing — useful context for any visitor wondering what happens to a Register entry once it's retired.

Bram Ntuli, Lecturer and Convenor, Improvement Grand Rounds, School of Continuous Improvement, convenes the standing review the School holds long after a project's own showcase slot has passed — the conversation Demo Quarter starts, not finishes.

Sten Okwuosa, Senior Research Fellow and Convenor, Impact Pathway Atlas, School of Continuous Improvement, traces how research effort becomes counted impact — the same record the route above ends on, one DOI at a time.

Come and join us

A tour is a small commitment. Applying is a larger one, and the University would rather you made it with a clear sense of what you're joining than a glossy one.

If the route above sounds like the kind of place you'd want four years, or a partnership, or an afternoon, book a visit and walk it yourself. Ask the guide anything; if the answer isn't obvious from the instrument in front of you, someone nearby is trained to explain it properly.

Everything the tour shows you is also sitting on the record at slop.university, dashboards and all, for whenever the next question occurs to you after you've gone home.

Come and see how it's actually run.
