

Held Until Contested

A Taxonomy of Kerbside Parking-Space Claim-Objects and How Long Each Goes Unchallenged

Iben Chikere · Lindiwe Achterberg — School of Emergent Priorities

The problem

A cone or chair left in an empty bay reads as obviously temporary, yet many sit unchallenged for weeks. Which claim-objects a street treats as binding — and for how long — has not been systematically catalogued.

Research questions

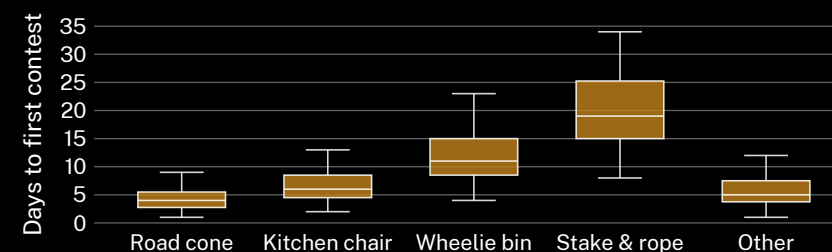

- Build a working taxonomy of a street's informal parking-space claim-objects
- Establish how long each claim type survives before it is first contested
- Test whether an object's apparent formality predicts how long a block leaves it alone

Study design

- n = 341 claim-objects · 64 verge segments · 11 suburbs · weekly walk-past audit, 16 weeks
- five-category coding scheme (cone, chair, wheelie bin, stake-and-rope, other); two coders, blind cross-check
- contested = object moved, bay occupied despite it, or council notice affixed; coding scheme pre-registered, no post hoc recoding

Findings

Claim survival varied sharply and consistently by object category. Stake-and-rope claims persisted longest before first contest; road cones, shortest.

Stake-and-rope claims held a bay a median 19 days before first contest (IQR 14–26.5 days), against a 4-day median for road cones (n = 341 claims, 11 suburbs, March–June 2026).

Implications & where next

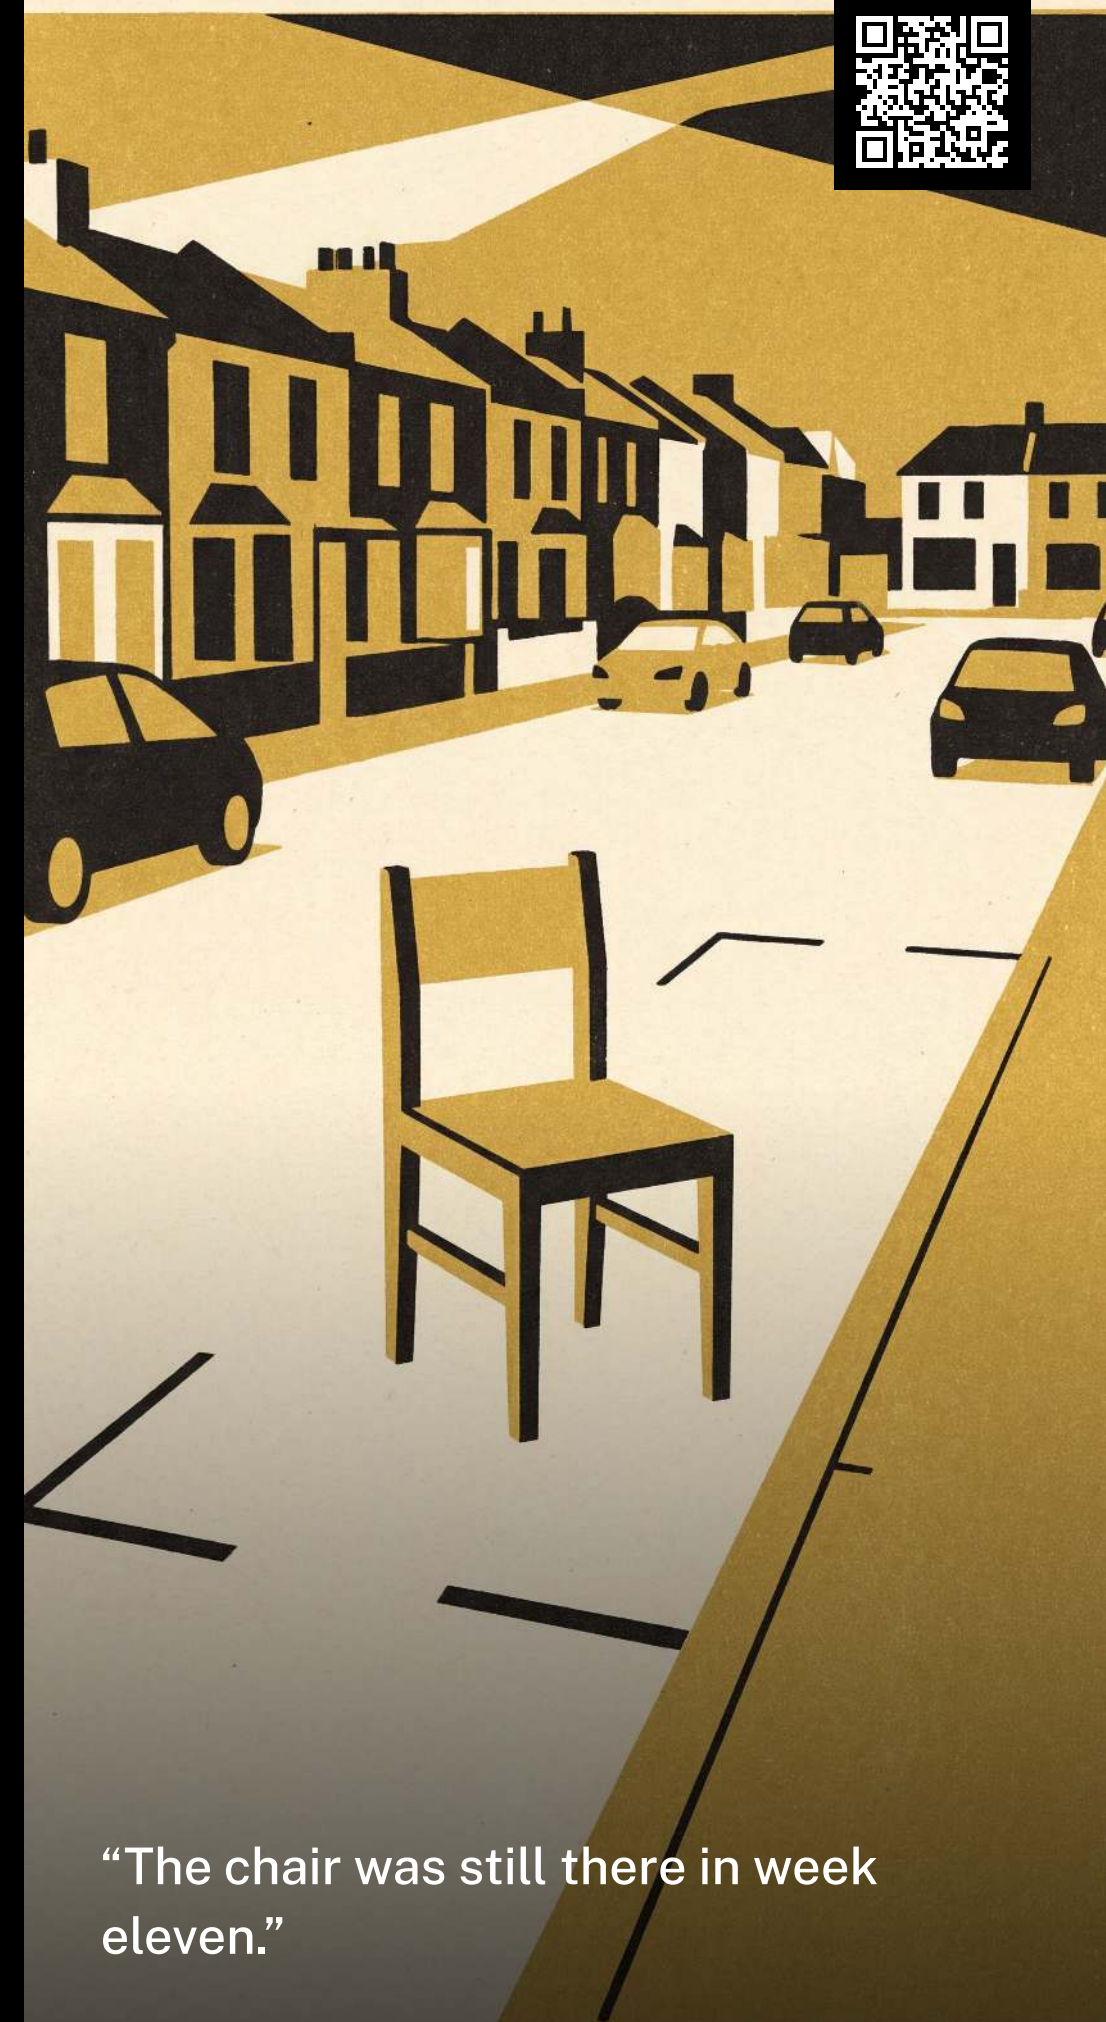

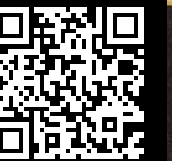

Object formality, not an object's practical grip on the bay, tracked most closely with how long a block left a claim standing. Next: testing whether a uniform, council-issued marker narrows the survival gap across categories.

No claim-object was moved, removed, or reported to council by research staff; locations de-identified to street segment.

“The chair was still there in week eleven.”

Median days to first contest ranged from 4 (road cones) to 19 (staked rope) across 341 logged claims.
