

Chosen for Shade, Priced for Power

A discrete-choice experiment on caravan-park site selection, against the tariff schedule that prices the connection

Runa Adegoke · Lindiwe Achterberg · Anouk Mensah — School of Emergent Priorities

The problem

Holiday-park tariffs price what a site is connected to: power, water, an ensuite. The guest at the office window is choosing on something else. Which attributes actually move a booking, and can the schedule that prices sites represent them at all?

Research questions

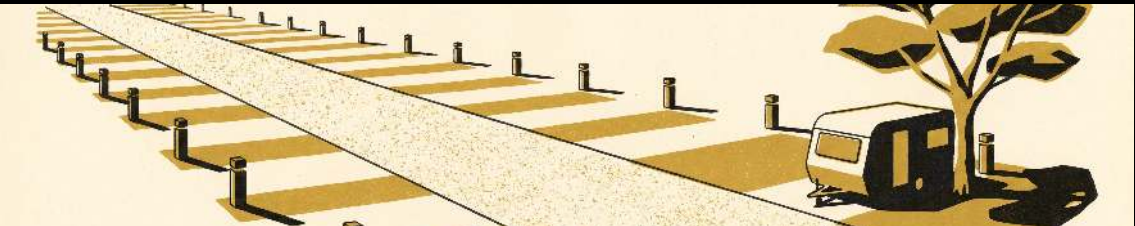

- Estimate part-worth utilities for the six site attributes bookers trade off
- Convert each to willingness to pay per night and set it against the posted loading
- Test whether attribute importance holds across stay length

Study design

- 612 recent bookers · 12 forced choices each · 7,344 choice tasks · 6 attributes · 9 parks · fielded over 14 weeks
- Mixed logit with correlated random coefficients; rate effects-coded and held orthogonal to the remaining five by design
- Attribute levels drawn from what the group's booking system already stores, plus shade and turning circle, which it does not; the design was locked before the tariff round opened

What we found

Shade leads at every stay length beyond a single night. Mains power, the schedule's largest single loading, ranks last for stays of three nights or more, and the walk to the amenities block overtakes nightly rate once a stay passes a week.

Attribute importance rank by stay length, from 7,344 choice tasks across nine parks, February to May 2026 (n = 612). Mains power, the largest single loading on the posted schedule, does not rise above third at any stay length.

What it means

A tariff can price only a field the system holds. Connections are fields; canopy is not. Shaded sites clear first through summer at the undifferentiated rate, and the review reads that occupancy as evidence the schedule is sound. The current round adds a site-quality loading, applied by connection tier, the only field available to apply it to.

Next: whether any park in the group records canopy at site level at all.

Choice tasks carried no park or operator identifiers. Attribute list and utility specification lodged with the School before fieldwork opened; neither was amended.

“Guests will pay three times more for the tree than for the power outlet.”

Willingness to pay per night: \$16.40 for a shaded site against \$5.20 for mains power. The posted schedule loads \$14.00 for the connection and holds no field for the tree.
